Internal transcribed spacer 2; ITS2; probe; Aspergillus flavus; A. niger;
A. terreus; A. nidulans; Fusarium solani; F. moniliforme; Mucor rouxii;

Internal transcribed spacer 2 (ITS2) and adjacent regions.

```
The present sequence represents an internal transcribed spacer 2 (ITS2) and adjacent regions. Probes can be derived from the present sequence which are species-specific. The specification also describes ITS2 sequence-derived probes for identifying a species selected from Aspergillus flavus, A. fumigatus, A. niger, A. terreus, A. nidulans,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A. terreus; A. nidulans; Fusarium solani; F. moniliforme; Mucor rouxii; M. racemosus; M. plumbeus; M. indicus; A. funigatus; M. circinilloides f. circinelloides; Rhizopus oryzae; R. microsporus; R. circinans; R. stolonifer; Rhizomucor pusillus; Absidia corymbifera; Cunninghamella elegans; Pseudallesheria boydii; Scedosporium apiospermum;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a genomic DNA sequence containing the 18S rRNA gene, internal transcribed spacer regions 1 and 2 (ITS1, ITS2) and 5.8S rRNA sequences from a mutant strain of Gibberella fukikoroi (LTB-1027) of the invention. This region of DNA is highly variable and can be used for species and strain differentiation. The LTB-1027 mutant produces a mixture of gibberellins which is at least 70 % GA 4 and GA 7. Gibberellins GA 4 and GA 7 promote flowering and Fruit cell elongation, and are used by growers of apples, pears and grapes to produce larger fruits and earlier harvests. The mixture of GA 3, GA 4 and GA 7 achieved using the method of this invention should be particularly useful in the apple industry where GA 4 has been found more effective in russet control and in promoting fruit set. This method produces GA 4 and GA 7 in much higher titers than prior art methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A new method for producing a mixture of gibberellins from fujikuroi results in high titers of GA4 and GA7 useful to flowering and fruit growth in the fruit growing industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2293 BP; 596 A; 527 C; 592 G;

                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel steroid compounds derived from the African CC soil fungus Fusarium sp. MF6381 (ATCC 74469) which act as inhibitors of CC HIV integrase. The invention encompasses cultures of Fusarium sp. MF6381. CC The invention also relates to a composition comprising a compound of the invention in combination with an AIDS antiviral agent, an immunomodulator CC and an antiinfective agent. The compounds of the invention may be used in CC the inhibition of HIV integrase and in the prevention and treatment of CC HIV infection. A wide range of state of HIV infection may be treated: CC AIDS (acquired immunodeficiency syndrome); ARC (AIDS-related complex); CC both symptomatic and asymptomatic HIV infection; and actual or potential CC exposure to HIV. The compounds may be used to isolate HIV integrase mutants which are potentially useful as screening tools for antiviral CC compounds. The compounds may also be used to establish or determine the site at which other antivirals bind to HIV integrase (e.g., by CC competitive inhibition). The present sequence represents the ribosomal CC MF6381, which may be used to characterise MF6381. (Updated on 15-SEP-2003 CC to standardise OS field)
                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                 This invention relates to the detection of a fungal pathogen comprising isolating DNA from a plant leaf infected with a pathogen. The methods and primers are useful for identifying fungal isolates of fungal pathogens and monitoring of disease development in plant populations. The present sequence represents an internal transcribed spacer RNA encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting a fungal pathogen, useful for monitoring disease development, comprises subjecting the DNA to PCR amplification using at least one primer having sequence identity with at least 10 contiguous nucleotides of Fusarium spp.

                                                                 which are species-specific. The specification also describes ITS2 sequence-derived probes for identifying a species selected from Aspergillus flavus, A. fumigatus, A. niger, A. terreus, A. nidulans, F. Humigatus, A. niger, A. terreus, A. nidulans, M. circinilloides f. circinelloides, Rhizopus oryzae, R. microsporus, R. circinans, R. stolonifer, Rhizomucor pusillus, Absidia corymbifera, Cunninghamella elegans, Pseudallesharia boydii (teleomorph of Scedosporium apiospermum), Penicillium notatum, or Sporothrix schenkii. The probes can be used for differentiating filamentous fungal species from each other and from other medically important fungi. (Updated on 17-OCT-2003 to standardise os field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-OCT-2003
25-MAR-2003
06-JAN-1999
                   This sequence represents an internal transcribed spacer (ITS) sequence of the invention. The primer pairs, based on the ITS sequences, are used for the PCR amplification detection of wheat Microdochium and Fusarium funga pathogens, especially M. nivale, F. graminearum, F. culmorum, F. avenaceum, F. poae, F. moniliforme or F. roseum. The two different strains of fungi show different symptoms during infection, which may or may not be due to infection. Barly identification of the strain causing the infection allows early, and more specific fungicidal treatment. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                           Wheat pathogen internal transcribed spacer sequences - used as for primers for the species-specific polymerase chain reaction of the pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Beck

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17-OCT-2003
17-FEB-1998
The present sequence represents the ITS1-ITS4 region of the 5.8S rRNA gene from the filamentous fungi Trichoderma harzianum strain IMI 352940. A novel liquid formulation based on strains of T. harzianum and T. viride, has the following composition (w/v%): 0.1-6 sorbitol; 0.02-2
                                                                                                                                                                                                                                                      Liquid formulation of Trichoderma harzianum and Trichoderma viride strains - are used as biological control agents against diseases of plants and plant material and as biolixiviation agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ITS1 ITS4 region; 5.8S rRNA; filamentous fungi; Trichoderma harzi liquid formulation; T. viride; gene recipient; increase activity; biological control agent; plant disease; biodeterioration; biolixiviation; leaching; ss.

CC harzianum IMI 352939 (3 x 105 to 10 x 107 conidia/ml), T. harzianum IMI 352940 (3 x 105 to 10 x 107 conidia/ml), T. harzianum ECT 20179 and/or T. viride CECT CC to 10 x 107 conidia/ml), T. harzianum ECT 720179 and/or T. viride CECT CC 20178. The Trichoderma fungi, alone or in combination, are used as gene crecipients to increase activity of the formulation as a biological control agent against diseases of plants and plant material and CC biological entities causing biodeterioration, and as a biolixiviation CC (leaching) agent. It is particularly used e.g. in agriculture, forestry and gardening; for controlling microorganisms which damage food and its CC packaging, construction materials, raw materials and manufactured CC packaging, construction materials, raw materials and manufactured CC packaging, construction materials, raw materials and manufactured CC on type of T. viride over other soil fungi makes them useful for control CC of plant diseases. Use of this formulation allows reduced application of CC polluting chemical pesticides and is thus more eco-friendly. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel base sequence which is part of a fully defined ribosome ribonucleic acid (rRNA) gene of Cordyceps crassispora. The base sequences can be used for the classification of Cordyceps sinensis. The sequence represents a C. sinensis rRNA sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23; Page

These primers are derived from the ITS sequences of these fungi (AAT05394-T05404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pseudocercosporella herpotrichoides; Mycosphaerella fijiensis; PCR; Mycosphaerella musicola; amplification; primer; ribosomal RNA gene; internal transcribed region; strain; capture; colourimetric assay;

                                       This represents the consensus DNA sequence of the internal transcribed spacer (ITS) region that was PCR amplified from Fusarium culmorum isolates, R-5106, R-5126 and R-5146. The invention provides a DNA molecule isolated from the ribosomal RNA (rRNA) gene region of a fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided. The method comprises isolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) are detected by visualising the amplified part of the ITS sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV62591 standard; DNA; 504

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the PCR amplification detection of wheat Microdochium and Fusarium fungal pathogens, especially M. nivale, F. graminearum, F. culmorum, F. avenaceum, F. poae, F. moniliforme or F. roseum. The two different strains of fungi show different symptoms during infection, which may or may not be due to infection. Early identification of the strain causing the infection allows early, and more specific fungicidal treatment. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to

No. 7e-51; Matches 262; Conservative 0; Mismatches 33; Indels 19; This invention relates to the detection of a fungal pathogen comprising isolating DNA from a plant leaf infected with a pathogen. The methods and primers are useful for identifying fungal isolates of fungal pathogens and monitoring of disease development in plant populations. The present sequence represents an internal transcribed spacer RNA encoding sequence Sequence 522 BP; 138 A; 141 C; 119 G; 124 T; 0 U; 0 Other; Claim 5; Page 38; 44pp; English. 509 302 391 ATTGATTGGCGGTCACGTCG-AGCTTCCATAGCGTAGTAGTAAAACCCTCGTTACTGGTA 182 348 122 CCCCGGGCCTGGCGTTGGGGATTCGGCGGAAGCCCCCTGCGGGCACAACGCCGTCCCCAA 181 288 228 AAAATGCGATAAGTAATGTGAATTGCAGAATTCAGTGAATCATCGAATCTTTGAACGCAC 287 62 2 AAAATGCGATAAGTAATGTGAATTGCAGAATTCAGTGAATCATCGAATCTTTGAACGCAC 61 AATACCCGCTGAAC 522 AATACCCGCTGAAC 315 ATACAGTGGCGGTCCCGCCAGCTTCCATTGCGTAGTAGCTAACACCTCGCAACTGGAG 241 CC---AGCTTGGTGTTGGGACTC------GCGAGTCAAATCGCGTTCCCCCAA ATTGCGCCCGCCAGTATTCTGGCGGGCATGCCTGTTCGAGCGTCATTTCAACCCTCAAGC ATTGCGCCCGCCAGTATTCTGGCGGGCATGCCTGTTCGAGCGTCATTACAACCCTCAGGC Gaps 449 390 347 121 4

         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BG BG

Patent No. 6372430

GENERAL INFORMATION:

APPLICANT: The Government of the United States of America as
TITLE OF INVENTION: Nucleic Acids for Detecting Aspergillus Species and
TITLE OF INVENTION: Nucleic Acids for Detecting Aspergillus Species and
TITLE OF INVENTION: Uncleic Acids for Detecting Aspergillus Species and
TITLE OF INVENTION: Nucleic Acids for Detecting Aspergillus Species and
TITLE OF INVENTION: 0.0043/1WP
CURRENT APPLICATION NUMBER: US/09/423,233

CURRENT FILING DATE: 2000-06-27

NUMBER OF SEQ ID NOS: 61

SOFTWARE: Patentin Ver. 2.0
